

A Lifeline for your data backups. Instantly.

With **nonstopIT's Lifeline DataVault** service we can provide you with a full backup solution with both an offsite Disaster Recovery solution plus instant access to inline backups. No tapes to purchase, manage or storage payments. Once running, there is minimal management and you have the peace of mind that all your data is stored in 3 locations; on your server, on your in-house Lifeline DataVault and offsite, fully encrypted, in our secured offices.

Continuous Offsite Data Protection ensures that current copies of files and multiple point-in-time versions of data are replicated in real time to the offsite Appliance for disaster recovery.

Minimal bandwidth impact on the network is ensured by only transmitting incremental changes to the offsite appliance.

Point-and-click data recovery enables the administrator to get business-critical systems up and running quickly and easily.

AES 256-bit encryption key ensures all data is securely transmitted and stored encrypted.

Remote Management enables administrators to log into the management console on the Lifeline DataVault to manage policy, settings and view statistics.

Confidential encryption key provides each end-user with total control of their data. nonstopIT employees have no access to the data.

Flexible configuration settings allow the administrator to send any or all mission-critical data residing on the appliance to the Offsite Data Backup portal.

Instant Access to lost data

Normal backups usually take place over night at times of low network and supporting infrastructure activity. This means that any data being created or amended during that day is at risk should a file be deleted, corrupted or even a server error occur. Utilising the Lifeline DataVault will give you instant access to the last saved version of your file.

Backup Multiple Device Types

The Lifeline DataVault can ensure transparent backups of Servers, Desktops and Laptops. Simply install the agent, define the policy and it becomes part of your secured data backups.

Data Recovery

Bad things happen. If your local infrastructure is unavailable for any reason; building closure; power outage; Fire; Flood... we will be able to place another DataVault at a location of your choice within a predetermined SLA. We can even ensure that your new DataVault arrives fully loaded with the last good backup.

Lifeline DataVault Local Archiving

The Local Archiving capability allows you to store the latest version of business critical data to a USB drive. Designed to help SMBs meet regulatory compliance, Local Archiving enables administrators to explore archives and restore individual files historically.

Bare Metal Recovery

There are occasions when your server may fail completely. We are able to offer an additional option of Bare Metal Recovery. This will expand your service to include operating systems and system configuration.
